

Security Labels offer Protection against

- Tampering
- Counterfeiting
- Unwarranted return of used goods in e-commerce

GUARD

LABELS

Any damages to the security label obligate to purchase

They speak a clear language: "Anyone who removes me is obliged to purchase!" – Guard Labels from eXtra4 cannot be removed and re-attached. As security labels they are irreversibly destroyed during removal.

Prevent misuse of consumer rights

Visible traces of use and still money back? – Enough of that when Guard Labels by eXtra4 are used. They prevent jewellery and watches from being worn without paying. If the security label is missing or has been damaged, it is immediately clear and demonstrable: the customer has no right to return, he must pay.

Repositioning impossible

Quick-witted consumers know many tricks to get rid of annoying labels and fix them later. From hairdryer to steam bath – the list of possibilities is long. However, none of these methods helps with Guard Labels. The special materials of the security labels decompose into their elements when manipulated. What remains is only label particles or tissue layers which cannot be reassembled.

Guard Labels

Protection Possibilities by Security Labels

Guard Labels can be produced as jewellery labels, eg. as loop label, but also in any other required shape.

Despite their special properties, Guard Labels can be printed on a thermal transfer printer with custom data just like conventional labels.

In professional colour printing it is also possible to apply a logo in advance. The logo preprinting can individually combine different protection factors to prevent the label to be exchanged for an imitation.

In this way, representative seals can be generated, which guarantee the pristine original state of goods by the brand's name.

Protection factor Self-destructing material

It splits into layers (as visible on the picture aside), it divides into smallest parts or tears.

The labels thus self-destruct irrevocably, whatever one tries to remove them after the first attachment.

Protection factor Blacklight-sensitive print

It is invisible by daylight or standard artificial light. As with money bills, it can only be recognised under a special blacklight lamp. Individual texts or logos can be printed like this.

Blacklight-sensitive printing can be overprinted with details of the goods or prices by standard thermal transfer printers and increase in that way – well hidden – the protection against counterfeiting.

Protection factor Hologram

Prefabricated holographic foils with standardized security note or symbol are used (eg. a security lock as shown in the picture).

Holographic patches can be printed on with details of the goods or prices by standard thermal transfer printers in scratch-proof quality and resisting to ultrasonic cleaning.

A hologram increases the counterfeit protection of the label. So replacing the original label by an imitation on possibly counterfeited goods is made difficult.

Protection factor Warning

Clear words help prevent. A meaningful warning message signals clearly: Whoever removes the security label exceed their rights as a consumer, and this act obligates to purchase.
