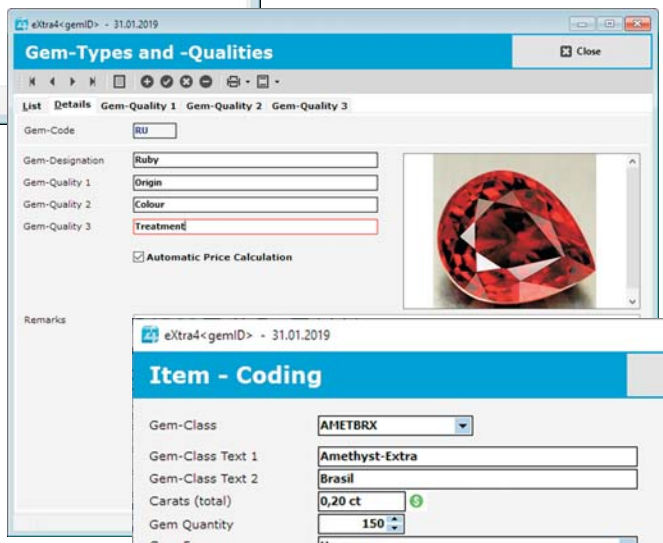
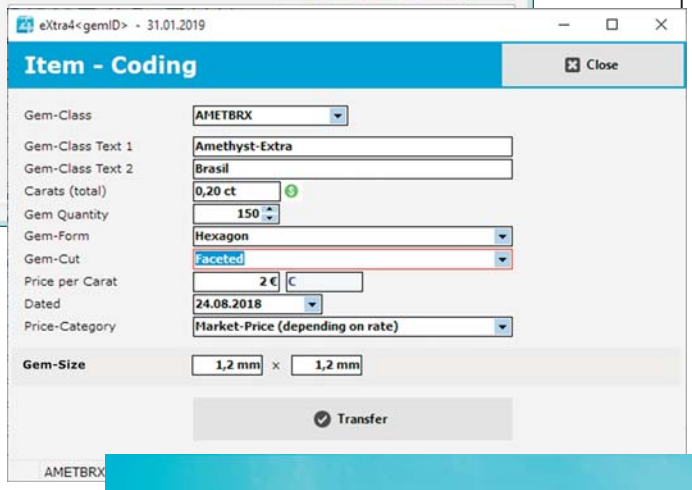
Software for the Lapidary Business

The program was co-developed by insiders from the gemstone industry. Core of the software is the gemstone classification.

Users store all relevant stone types with their qualities, cuts, and shapes in the software on site. From this, gem classes are created and each item is assigned accordingly. For better identification, an image of each gemstone can additionally be stored. In combination with the carat weight, the categorization finally gives each single gemstone a unique profile based on its individual characteristics.





This unique profile is encrypted by the software and printed on a label in three different ways: as descriptive key for trained sales personnel, as machine-readable matrix code for scanners, as plain text in excerpts for customer sales talks.

The code provides access to all sales-relevant data anytime and anywhere – without any connection to a database. Via a scanner the data can be read and processed, for example to lists or to take orders.

The single-user solution operates as edition "Basic" with a database integrated on a local workstation computer. In contrast the edition "Business" uses the multi-user client/server database PostgreSQL. This allows direct database access from any number of workstations.

from € 299,-
